About teeth whitening

How does teeth whitening work?

Opalescence™ whitening gels contain an active whitening ingredient. Active oxygen molecules from the whitening agent are able to pass through the enamel of the teeth, where they react with and neutralize the discolored molecules that cause tooth discoloration. The active oxygen molecules spread, whitening the entire tooth.

Will whitening cause tooth sensitivity?

Tooth sensitivity can occur as a result of whitening. If sensitivity occurs, it is temporary and typically disappears within a few days after the completion of whitening treatments. Desensitizing treatments can be used to help treat or prevent sensitivity.

Will whitening with Opalescence™ whitening products weaken my teeth?

No. Opalescence™ whitening products have not been shown to weaken teeth.^{3,4}

How long do whitening results last?

Teeth whitening results are very stable, leaving you with a stunning smile long after treatment is over. However, there are a few factors that can make teeth lose their brightness. Things like diet and certain habits (like smoking) may affect the length of your whitening results. Fortunately, touch-up treatments are quick and easy, helping you get that bright, white smile back.

Why choose Opalescence?

Who can whiten?

Almost anyone can successfully whiten their teeth. We see patients of all ages whiten — from young adults to 90-year-olds.

Cosmetic tooth whitening is legally permitted at the age of 18.
