Tattoo Removal

Q-Switched Lasers are considered by dermatologists to be the most effective, safe and reliable way to remove unwanted multi-coloured tattoos with consistent, predictable results.

- Proven safety record
- Treatment sessions are quick
- We can fade or cover up
- Precise and targeted treatments

How does the treatment work?

Q-Switched Lasers generate a high powered beam of laser light in an extremely short pulse. This very short pulse of high powered laser light is absorbed by the tattoo's ink particles, breaking these down into smaller pieces and enabling your natural immune defences to absorb the ink. Gradual fading of the tattoo occurs over a series of treatments.

What does a laser treatment feel like?

Most patients describe the sensation as similar to a hot pinprick or the flick of an elastic band. Whilst this is mildly uncomfortable, most people tolerate treatment well. A skin cooling device may be utilised to reduce any discomfort.

How many sessions will I need?

This depends on several factors, including the density and colour of inks and the age of the tattoo. Amateur tattoos can be quick to remove, taking between 1 to 6 treatments. Professional tattoos vary considerably and some can take up to 15 treatments. Repeat treatments are spaced every 6-10 weeks. Generally, a course of treatments is required for optimum results.

Who is suitable for treatment?

Most people are suitable for treatment. We recommend a consultation with your clinician to ascertain if the treatment will be successful for you.

Pigmentation

Pigmentation such as sun spots, age spots, and brown birthmarks can be targeted to create a more flawless, youthful and glowing appearance.

- Proven safety record
- Treatment sessions are quick
- We can fade or cover up
- Precise and targeted treatments

How does pigmentation removal work?

Short pulses of light are released and are readily absorbed by the high concentration of melanin found within pigmented lesions. The rapid absorption of light energy heats the melanin and causes the destruction of the melanin-rich cells. This triggers the body's natural healing process to stimulate the growth of new, healthy skin tissue.

What does a laser treatment feel like?

Most patients describe the discomfort as mild and tolerable and no anaesthesia is required.

How many sessions will I need?

The number of sessions will depend on the type and size of the pigmented lesion but typically a minimum of 3 and up to 6 sessions treatments are recommended.

Treatments are carried out every 4 to 6 weeks. Following your course of treatments, top-up sessions are performed as required, but usually once or twice a year.

Who is suitable for treatment?

Most people are suitable for treatment. We recommend a consultation with your clinician to ascertain if the treatment will be successful for you.

Large, dark, mottled or raised pigmentation cannot be treated and may need to be checked by a dermatologist. Large, dark moles should not be treated, nor should lesions covering a large part of the body. The pigmented marks that respond the best are those caused by sun damage (sun spots and age spots).

Carbon Facial

The Carbon laser facial will leave your skin looking smoother, brighter and less tired.

- Reduces fine lines and wrinkles
- Tightens pores
- Reduces discolouration
- Removes dead skin cells
- Improves skin texture
- Stimulates collagen growth

How does a carbon laser facial work?

A layer of liquid carbon will be applied to the face, this penetrates deep into the skin's surface. Pulses of laser light blast the carbon particles away to create a more youthful, even complexion. In addition, the laser energy stimulates the fibroblast cells, leading to increased production of new collagen and elastin. This improves the texture and appearance of the skin, evening out discolouration and shrinking pores, whilst reducing the appearance of lines and wrinkles.

What does the treatment feel like?

Treatment can be mildly uncomfortable, but no anaesthesia is required. Most people describe the discomfort as moderate and acceptable, feeling warm and like a quick pinprick.

How many sessions will I need?

Results can be seen after just a few treatments. However, a minimum of 3 and up to 6 sessions, are recommended depending on your skin concerns.

Treatments are carried out every 4 to 6 weeks. Following your course of treatments, top-up sessions are performed as required, but usually once or twice a year.

Who is suitable for treatment?

Most people are suitable for treatment. We recommend a consultation with your clinician to ascertain if the treatment will be successful for you.

What is this treatment ideal for?

This treatment is ideal for:

1. Reducing excess oil and sebum
2. Refining and minimising enlarged pores
3. Managing pigmentation and hyperpigmentation damage
4. Lessening the appearance of fine lines and wrinkles
5. Reducing active acne

Fungal Nail

With the Luminette Q we can use laser light to destroy the fungus that causes fungal nail infections.

- Proven safety record
- World-leading technology
- Precise and targeted treatments

How does the laser work?

Light is absorbed by the water in the skin underneath and around the nail, creating heat. This heat helps to eliminate the fungal infection. The laser applicator is placed on the nail and a short pulse of light is released. The entire nail bed and nail matrix is then treated in this way.

What does a laser treatment feel like?

A warm sensation and some discomfort are felt during treatment. However, a skin cooling device can be used to make treatment as comfortable as possible.

How many sessions will I need?

The number of treatments required varies, although typically 3-6 treatments are needed for optimum results.

These results become apparent as the nail grows out. Due to the slow rate of toenail growth it may take several months for the results to be seen.

Who is suitable for treatment?

Most people are suitable for treatment. We recommend a consultation with your clinician to ascertain if the treatment will be successful for you.
