Dairy Analytics

On farm data service combines
milk, feed and robot data

The world is becoming more and more data driven. Having data is nice but being able to do something with it is something else. We help you with that!

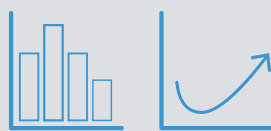

FEED DATA

MILK DATA

ROBOT DATA

Of all clients collected in Dairy Analytics!

Combined feed and milk data gives you valuable insights!

Dairy Analytics. On Farm Data Service

Milk, feed and robot data of all clients collected in one program

A large amount of data is available in the dairy farming sector. With all this data you can do many useful things. However, collecting data and presenting it can be complex. The On Farm Data Service of AgroVision brings all the feed and milk data together. From milking robot to cow feeding station. This ensures that advisors do not have to collect data from different places. You can quickly establish a relationship between feed and milk. After adjusting the ration, it is possible to see within 24 hours what are the consequences of the advice. And more importantly, it does not matter which process computer the farmer uses, and which management system is running. AgroVision can connect to all process computers and therefore to all of your clients.

Advisor dashboard for a quick overview

Want to get a quick overview at the start of the working day of all dairy farms where you give advice? The advisor dashboard shows the deviations in milk and rest feed of the linked companies each day. It is therefore very easy to proactively approach a dairy farmer where deviations are visible.

The advantages of Dairy Analytics:

- Quick insight into the performance of your clients
- Milk and feed data combined
- For all types of milking robots and process computers
- Regardless of management system
- Better advice through real-time data
