

Nutriforte[®]

Pigs

Support throughout the entire cycle

- ◆ Promotes development of the musculoskeletal system
- ◆ Supports hormonal balance and fertility
- ◆ Positive effect on technical results
- ◆ More efficient utilisation of nutrients

Performance

Kanters

Healthy Animals, Healthy Farm

Nutriforte

Production animals are under a lot of pressure to perform, which demands a lot from their body. Therefore, animals benefit from structural support throughout their production cycle. Nutriforte is suitable for long-term use, to supplement nutrients and stimulate the natural immune system. Nutriforte is a liquid mixture of multiple nutrients. This makes Nutriforte applicable via the drinking water or feed of the animals.

What is Nutriforte Pigs?

Nutriforte Pigs has been specially developed to meet the increased nutritional requirements of growing gilts, pregnant sows and lactating sows. By providing easily accessible minerals, amino acids, vitamins and organic acids via the drinking water, the animals are better able to cope with suboptimal conditions and periods of increased nutritional requirements. Nutriforte Pigs is suitable for continuous use to supplement essential nutrients, support tissue development and strengthen the natural immune system.

What are the benefits?

- ◆ Promotes development of the musculoskeletal system
- ◆ Supports hormonal balance and fertility
- ◆ Positive effect on technical results
- ◆ More efficient utilisation of nutrients
- ◆ Supports the immune system
- ◆ Lowers the pH of the drinking water

Working mechanism

The rich composition of Nutriforte Pigs ensures a versatile effect. The organic acids lower the pH in the gastrointestinal tract, inhibiting the growth of potentially pathogenic bacteria and improving protein digestion. The amino acids play a fundamental role in the formation of the skeleton and muscles, minimising the risk of weak points in the musculoskeletal system. The generous dose of easily absorbable zinc helps develop and maintain strong hooves, tendons and other tissues. In addition, zinc is essential for the production of fertility hormones, and a deficiency can result in poor insemination rates and increased embryonic mortality. The vitamin complex plays an important role in energy metabolism and in the digestion of fats, carbohydrates and proteins, thus making an essential contribution to overall vitality.

Dosage

1 - 3 litres of Nutriforte Pigs per 1000 litres water

Dosage depends on the pH of the drinking water after adding the product. The pH value must be below 4, preferably 3.8.

Clean the drinking water system with Aqua-clean before starting with Nutriforte Pigs. Stop dosing Nutriforte Pigs at least 12 hours before medication via the drinking water.

Packaging

20 kg can
225 kg drum
1150 kg IBC
