Introduction

To produce a high-voltage resistor, we must choose suitable coating materials, which balance heat dissipation capacity and insulation performance. Generally speaking, the heat dissipation capacity of silicone resin is better than that of epoxy resin, but the insulating capacity is not as good as epoxy resin. RESI selected a high-level epoxy resin coating material to produce our high-voltage resistor that is good at both insulation and heat dissipation capabilities. There is no air bubbles on the surface after the encapsulation, and the insulation ability is significantly better than silicone resin and other epoxy resins. The heat dissipation capacity is also better than other types of epoxy resin.

Introduction

Precision Mn-Cu automotive shunt adopts specialized alloy materials, and conducts precision heat treatment process, electron beam welding process and high-precision Trimming Free technology, achieving low thermal EMF and low inductance. Kelvin connection is adopted for current sensing. The voltage output structure is various, with four types of structures: PIN, M3 hole, standard, and standard nickel plated.

Current sensing module used to assist in measuring bidirectional DC current. It has high accuracy, low TCR, low inductance, low thermal EMF, and excellent long-term stability and anti-interference ability. This module is designed based on a low-TCR shunt, which is welded with PCBA and can be installed on the circuit through bolts. It is used to collect bus current and shunt temperature, and send the measured signal to the signal processing side of the user defined module. It can be customized according to the specific technical requirements.
