

Calling a Forklift for Empty Pallet Collection

Signal tower notifies empty pallet pick-up request for efficient collection.

Issue

Calling forklift to pick up empty pallets via transceiver may result in a buildup of empty pallets as drivers of the forklift may miss the call.

Proposal

When the empty pallets are piled and the operator presses the call button, the WIO sends a signal wirelessly to the signal tower (LR10) to cue in the forklift driver to pick up the empty pallet. It also reduce the use of transceivers to be used for other purposes.
