

Assemblies for the industrial automation

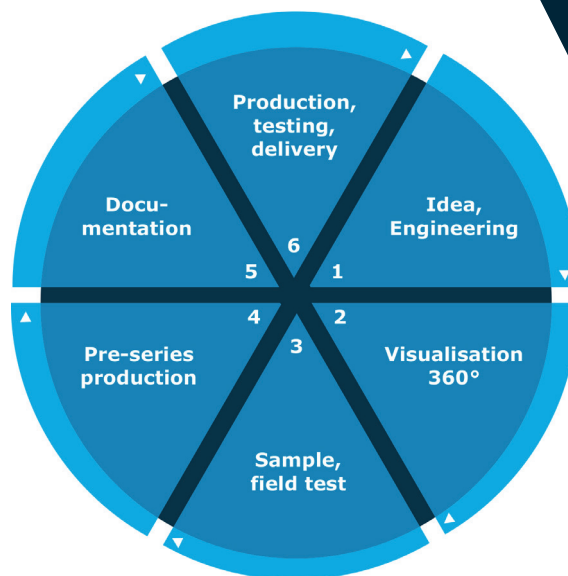

When conventional standard products no longer cover customer requirements, customisation to your application begins. Our strength lies in the engineering of simple to sophisticated assemblies. The focus is always on your application, your process and your industry. Together with you, we will find the technically and economically optimal product solution. True to our guiding principle **we** understand.

Stronger thanks to individual customisation

- Creative engineering increases productivity and quality.
- Supplier reduction simplifies procurement processes.
- Cost optimisation brings real added value.
- By outsourcing to us, you can relieve your development and assembly resources.
- Everything from a single source from our location in Hünenberg ZG leads to shorter delivery times.

On the way to your finished assembly

From the idea to your customised assembly, we go through 6 steps with you. We combine your idea, or perhaps ours, with the expert advice and technical know-how of our employees. This results in new, exciting solutions. After defining the function, drawings and 3D models are developed providing a 360-degree view. We work closely together during all phases up to the finished assembly. Let us manufacture a high-quality, customised solution from A to Z from a single source.

Full service from a single source

Engineering, design and production go hand in hand for us. From the design on the CAD system to the detailed construction, we develop and visualise complex requirements. Standards and directives such as ISO, IEC/EN, SIL, FDA, TA-Luft and ATEX are at the heart of everything we do. With the production of samples, prototypes and pilot series, we ensure suitability for practical use.

Reliability and precision in the assembly

In the assembly of components, complete solutions are created from individual parts. Two assembly teams work at TRI-MATIC on a wide variety of tasks every day, always accompanied by written testing instructions. If required, the instructions will be worked out together with you and include the individual assembly steps.

Quality control: Monitor and optimise

The increasing quality demands of customers make comprehensive quality control as a production step indispensable. With a practised organisational management system according to ISO 9001, we continuously monitor our production processes and thus detect defects at an early stage through inspections.

Every day, assemblies leave our assembly hall tested and in perfect quality. With a holistic understanding of components and materials as well as consistent process reliability and experience, we achieve the required result.

Documentation & packaging: Complete, safe and careful

Technical documentation and certificates are as important as the product itself. All standard products and assemblies are fully documented with data sheets, drawings, circuit diagrams and 3D models. We also create customer-specific documentation and describe test procedures. This is how you optimise your further processes.
