

PTFE-T Liner replaces existing PTFE-Liner in SBP Butterfly Valves

From now on, the liners of our butterfly valves will be gradually switched from PTFE to the modified PTFE-T. In the initial phase, this change exclusively affects the butterfly valves. In the long run, we plan to extend the use of the new material – pending further internal evaluations and tests.

The goal of this change is to offer you a technically optimized solution. **PTFE-T offers several advantages compared to conventional PTFE, including:**

- Lower permeation
- Improved mechanical and thermal properties
- Higher resistance to cold flow (creep)
- Extended service life

For additional advantages, please refer to the second attachment.

During the transitional phase, stocks of the previous version will still be available. New item numbers will be introduced with this change.

There will be no impact on your pricing – you will benefit from an improved material at the same price. **Please be aware** that if stocks of the previous PTFE material are still available, a surcharge for the superior PTFE-T material will apply. Once the existing stock is depleted, the usual price will apply to the new PTFE-T product.

In the future, we plan to switch additional products to PTFE-T – including our SBC Ball Check Valves. We will keep you informed in due course.
