Nestable and stack/nest containers

We nest it to gain space

Nestable containers

Nestable containers are stacked using either the lid or on pull-out bail arms. When empty, they can be nested, this allows a significant reduction in volume.

Nesting system

Two containers are stacked on top of each other on plastic bail arms. In order to make sure the containers are nestable, the bail arms are folded back. Afterwards, the containers can be nested into each other.

Every turn is a win

Space saving

Stack/nest containers are stackable containers that are nested when empty, thus allowing a significant reduction in volume. Containers for alternate stacking are stackable in one position due to their design. Turning the upper container around 180 degrees means that two boxes can be nested into one another.

The transport volume is thereby reduced by up to 85 %, depending on the type of container.
